

Engenharia de Softwares Escaláveis

Domain-Driven Design (DDD) e Arquitetura de
Softwares Escaláveis com Java

Agenda

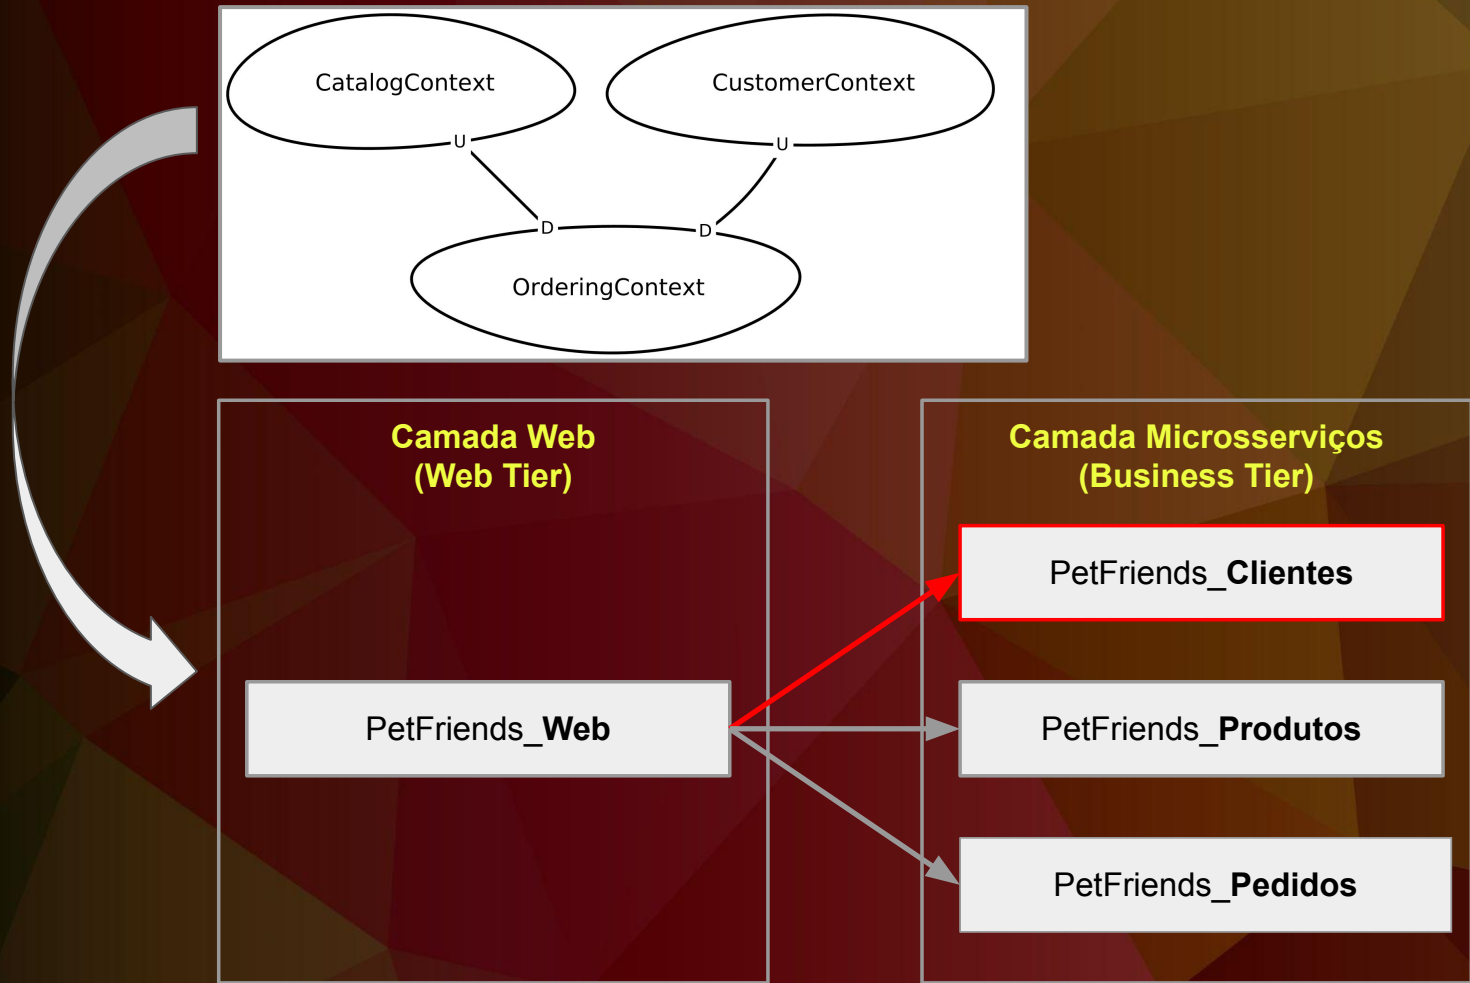

Etapas 2: Aplicando Aggregates e Bounded Contexts - Parte 2.

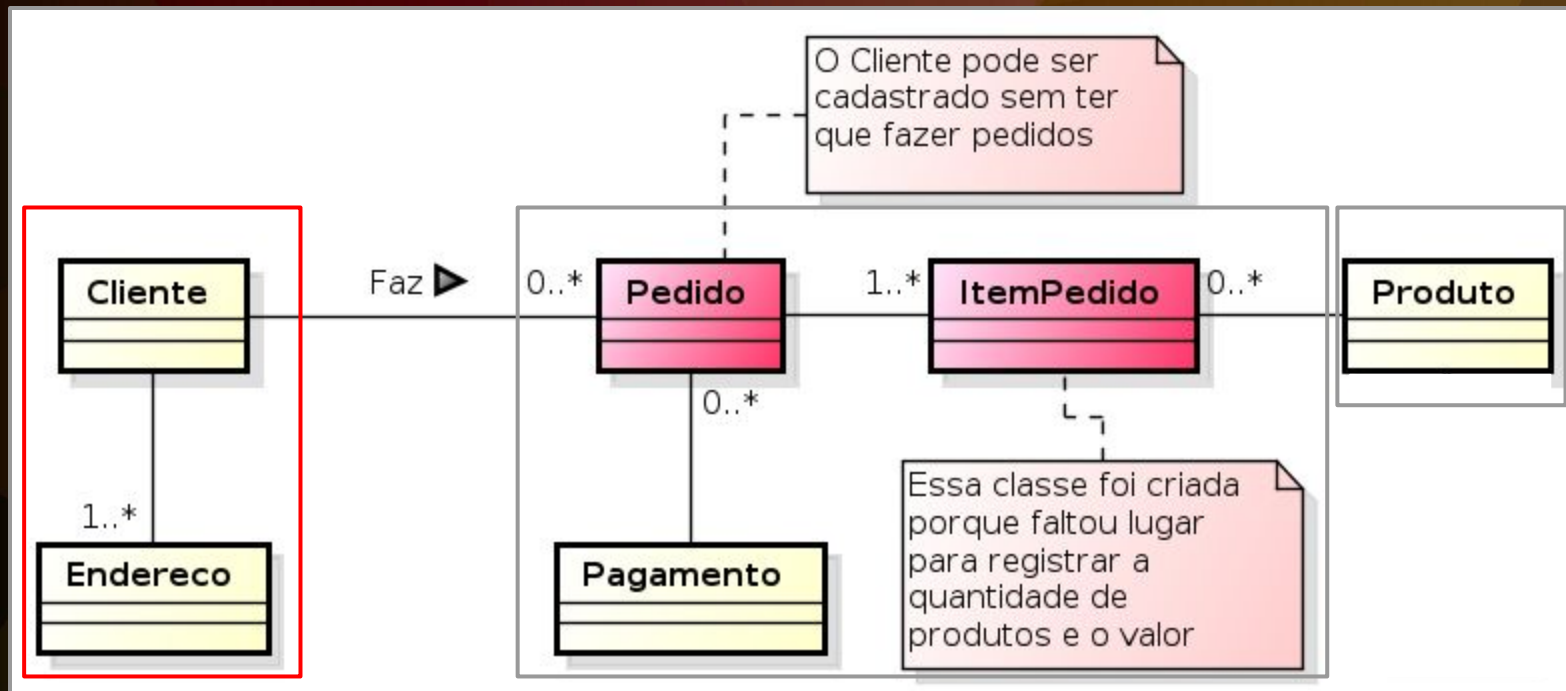

- Criando um Projeto Spring Boot.
- Aplicação de Value Object em Entities.
- Construção de Aggregates.

Criando um Projeto Spring Boot

New Spring Initializr Project

Steps

1. Choose Project

2. Base Properties

3. Dependencies

4. Name and Location

Dependencies

Spring Boot Version: 4.0.0 (M3)

Filter

Frequently Used

☒ Spring Web

☒ Spring Data JPA

☒ H2 Database

☐ Spring Integration

☐ Google Cloud Messaging

☐ GraphQL DGS Code Generation

☐ Lombok

Developer Tools

☐ GraaVM Native Support

☐ Spring Boot DevTools

☐ Spring Configuration Processor

☐ Spring Modulith

Web

☐ Spring Reactive Web

☐ Reactive HTTP Client

☐ Rest Repositories

☐ Spring Session for Spring Data Redi

☐ Spring Session for JDBC

New Spring Initializr Project

Steps

1. Choose Project

2. Base Properties

3. Dependencies

4. Name and Location

Name and Location

Project Name: DR4_E2_A1_Entity

Project Location: /home/armeniocardoso/javaProjects/2025.4

Project Folder: /home/armeniocardoso/javaProjects/2025.4/DR4_E2_A1_Entity

☒ Run/Debug trough Spring Boot maven plugin

☒ Remove Maven Wrapper

5

```

Aplicação de Value Object em Entities

1

The screenshot shows an IDE with a project named DR4_E2_A1. The project structure on the left includes source packages, test packages, and other sources. The main editor displays the code for the `Pessoa.java` file, which is a simple entity using Jakarta Persistence annotations. The code defines a `Pessoa` class with an `id` attribute and two `String` attributes, `nome` and `email`.

```
1 package br.edu.infnet.pessoas.domain;
2
3 import jakarta.persistence.Column;
4 import jakarta.persistence.Entity;
5 import jakarta.persistence.GeneratedValue;
6 import jakarta.persistence.GenerationType;
7 import jakarta.persistence.Id;
8 import jakarta.persistence.Table;
9
10 @Entity
11 @Table(name = "pessoas")
12 public class Pessoa {
13
14     @Id
15     @GeneratedValue(strategy = GenerationType.IDENTITY)
16     private long id;
17
18     @Column(name = "nome")
19     private String nome;
20
21     @Column(name = "email")
22     private String email;
23
24     @Column(name = "fone")
```

Criamos uma entidade simples, baseada em um design anêmico

The screenshot shows an IDE with the following components:

- Project Explorer (Left):** Displays the project structure for `DR4_E2_A1`. The `Pessoa.java` file is selected under `br.edu.infnet.pessoas.domain`.
- Editor (Right):** Shows the code for `Pessoa.java`. The code is as follows:

```
1 package br.edu.infnet.pessoas.domain;
2
3 import ...6 lines
4
5 @Entity
6 @Table(name = "pessoas")
7 public class Pessoa {
8
9     @Id
10     @GeneratedValue(strategy = GenerationType.IDENTITY)
11     private long id;
12
13     @Column(name = "nome")
14     private String nome;
15
16     @Column(name = "email")
17     private Email email;
18
19     @Column(name = "fone")
20     private Telefone fone;
21
22     public Pessoa() {
23     }
24
25     public Pessoa(String nome, Email email, Telefone fone) {
26         this.nome = nome;
27         this.email = email;
28         this.fone = fone;
29     }
30 }
```

A red box highlights the `@Column(name = "email")` and `@Column(name = "fone")` annotations and their corresponding private fields `email` and `fone`. A speech bubble points to these fields with the text: "Agora queremos usar nossos Value Objects como propriedades das entidades".

Construção de Aggregates

Agregado é um padrão em DDD que define um grupo de objetos de domínio que pertencem ao mesmo contexto delimitado e mudam juntos.

Ele tem uma **entidade raiz**, que é o principal ponto de entrada para acessar o **Agregado**.

A entidade raiz é responsável por impor as regras de negócios e invariantes do **Agregado**.

Ele tem uma ou mais **Entidades** e **Objetos de Valor** que representam os conceitos e comportamentos do domínio.

Ele tem um limite, que define o que está dentro e fora do **Agregado**. O limite também determina o escopo de consistência e transações para o **Agregado**.

Ele tem uma identidade, que geralmente é derivada da entidade raiz. A identidade permite que o **Agregado** seja referenciado e manipulado por outros agregados ou serviços.

Um exemplo de agregado é um **Pedido** e seus itens de linha.

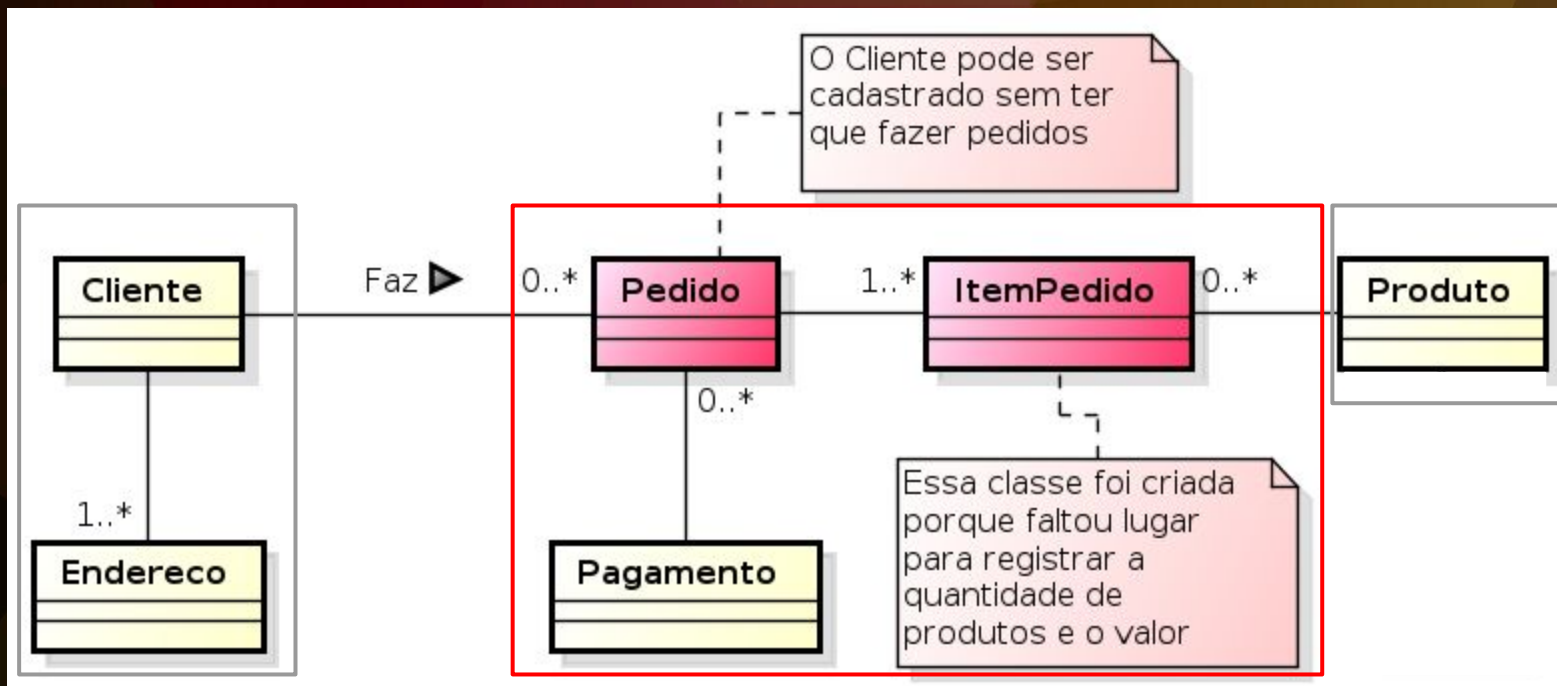

Pedido é a entidade raiz, que tem uma identidade (número do pedido), um estado (status, valor total, etc.) e um comportamento (colocar, cancelar, enviar, etc.).

Os itens de linha são objetos de valor, que representam os produtos e quantidades pedidos.

Pedido e seus itens de linha formam um agregado, que tem um limite que o separa de outros agregados (como clientes ou produtos).

O agregado do **Pedido** garante que as regras de negócios e invariantes sejam satisfeitas, como por exemplo:

- Um pedido não pode ter itens de linha zero ou negativos.
- Um pedido não pode ser enviado se for cancelado ou não pago.
- Um pedido não pode ser modificado depois de enviado.
